

Lesson 6 Assessment

Handling API Responses, Errors, and Rate Limits

Implementation & Screenshot Evidence

This document summarizes the n8n workflow implementation visible in the supplied assessment screenshots. It covers retry handling, Continue on Fail, API pagination access, request throttling, and global error handling.

Requirement	Evidence / Implementation
HTTP Request Retries	Fetch With Retries — GET request to JSONPlaceholder with retry behavior configured.
Continue on Fail	Call That May Fail (Continue On Fail) — httpstat.us/500 used to demonstrate error output while execution continues.
Pagination API	Fetch Paginated Users — ReqRes API with per_page = 3; response shows page, per_page, total_pages and data.
Rate-limit prevention	Throttle (Wait 2s) — Wait node configured for 2 seconds.
Global error handling	On Workflow Error → Capture Error Details; execution/workflow/error information is mapped.

Validation Checklist

Item	Status
HTTP Request retry configuration	PASS
Continue on Fail configured and tested	PASS
Pagination API request	PASS
Wait node for throttling	PASS
Global Error Trigger workflow	PASS
Pagination loop	PENDING — not visible in supplied screenshots
Loop safety limit	PENDING — not visible in supplied screenshots

Workflow Structure

Main workflow: Start → Fetch With Retries → Call That May Fail (Continue On Fail) → Throttle (Wait 2s) → Fetch Paginated Users

Global error workflow: On Workflow Error → Capture Error Details

Assumptions & Limitations

- Public APIs are used as test endpoints.
- The 500 endpoint is intentionally used to demonstrate failure handling.
- The supplied screenshots prove paginated API data is returned, but do not prove a repeat-until-last-page loop or explicit loop-safety limit.
- If these two items are not yet implemented in n8n, they should be added before final LMS submission.

Screenshot Evidence

Main workflow.

Global Error Handler workflow.

Fetch With Retries configuration.

Continue on Fail configuration and error output.

Throttle (Wait 2s) configuration.

Final Submission Note

The LMS submission should include the Loom/YouTube demo and the latest exported n8n workflow JSON. The demonstration should visibly cover retries, Continue on Fail, pagination, Wait/throttling, and the Error Trigger workflow.
